

Simple Book publisher system

It is the system for writers, where they can publish/store their books. Also, they can update, create, delete their books.

All authors should firstly authorize before they will do something in this system. And also, they can work (edit, create, delete) only the books that belongs to them.

There will be subscribers. They will get notification when some changes will occur on books.

Entities: Author, Book, Subscriber

Beans: BookList(), AuthorList(), Subscribers(), etc.
